

AI BACKEND ARCHITECTURE

A BEAUTIFUL AI APP MEANS NOTHING IF THE BACKEND CAN'T THINK,
COMMUNICATE, AND SCALE.

WHAT IS BACKEND?

- The brain of every application.
- Processes requests and business logic.
- Connects databases and AI models.
- Handles security and authentication.
- Sends responses back to users.

WHAT IS AN API?

- API = Application Programming Interface.
- A bridge between two applications.
- Sends requests and receives responses.
- Allows apps to communicate securely.
- Used in almost every AI application.

WHAT IS ASYNC THINKING?

- Don't wait for one task to finish.
- Run multiple tasks simultaneously.
- Improves speed and performance.
- Keeps applications responsive.
- Essential for AI applications.

WHAT IS AN EVENT-DRIVEN SYSTEM?

- Reacts when an event happens.
- One action triggers another.
- Automates workflows.
- Reduces manual processing.
- Common in modern AI systems.

WHAT IS A REQUEST LIFECYCLE?

- User sends a request.
- Backend processes the request.
- AI generates a response.
- Backend validates the output.
- Response returns to the user.
